# EXTRAGALACTIC RADIO SOURCES

SYMPOSIUM No. 97

A wide variety of interesting objects and phenomena can be effectively grouped under the heading of 'Extragalactic Radio Sources', and indeed a diverse set of topics is discussed in this volume. Radio galaxies, quasars, Seyfert galaxies and BL Lacertids receive the most attention, but normal galaxies, the galactic center, and even SS433 are also discussed. While the unifying theme of the book is radio emission, studies at all wavelengths - X-ray, UV, optical, IR, and radio - are included. In general, the emphasis is on individual objects and the physical processes associated with them, but there are also papers on statistical studies and cosmology.

Most of the 28 invited and 120 contributed papers presented at the symposium are included. Together they provide an up-to-date view of the current state of our understanding of radio galaxies, quasars and other extragalactic objects that are strong radio emitters.
