

Remote Viewing of SEM – A Versatile Tool for Failure Analysts and the Materials Community

Chirag G. Shah

Exova, Chicago

A state of the art remote viewing system recently installed on the subject SEM (scanning electron microscope) offers a great advantage to failure analysis and the materials community. The system offers an ability to analyze and diagnose a given issue or problem remotely.

One can view exactly how the fracture surface or any sample looks in the SEM via a highly secure and encrypted internet connection through computer. Troubleshooting and solutions can be developed in real time, improving ones productivity, profitability and customer satisfaction. A live demonstration of the “SEM ANYWHERE”TM system would be provided at the symposium.
