

RESPIRONICS

SAVE TIME, SAVE PATIENTS

SealEasy™ Resuscitation Mask:

The best seal is also the fastest. Give your patient the benefit of the most efficient seal available—"The Blob"—with just one size to fit any adult face on the first try...even with inexperienced hands, even on bearded or elderly faces. Give yourself the reassurance of a valve that vents exhalation away from you. Six airways, color-coded by size for fast recognition, snap in easily.

BagEasy™ Disposable Manual Resuscitator:

High tidal volume and high FIO₂ are quick to deliver. The 2100 cc bag provides your patient a large volume with every squeeze and gives you a good feel for airway patency and lung compliance. The exclusive double-swivel neck lets you work quickly and effectively, even in the tightest rescue situations. The BagEasy is as rugged as any reusable resuscitator, but adds the assured sanitation of a disposable.

Seconds can be worth a lifetime in a rescue. So Respironics designs rescue products specifically to save time. Every one helps you establish an effective airway fast—even in tough rescue situations. And the faster for you, the better for your patient. Call or write for detailed data sheets on each product.

Easy Products Mean Critical Care Solutions™

ReviveEasy™ Ptl® Airway:

Get a patent airway the first time with the least trouble.

The Ptl Airway works whether you intubate the trachea or the esophagus. Either way, the Ptl helps prevent patient aspiration of blood and secretions. When intubation is not possible, the Ptl provides ventilation and oxygenation equivalent to an ETT—

even in facial injury and c-spine cases.

SecureEasy™ Quickstrap ETT Holder:

Because this is no time for extubation.

SecureEasy's non-elastic headband and unique tube holder help inhibit accidental extubation, which saves you time-consuming re-intubation and helps reduce patient airway trauma. The built-in bite block helps to prevent airway occlusion and the problems it can cause. No tape or adhesives are needed, so SecureEasy holds even to sweaty, bearded, or traumatized faces.

The Berg Resuscitation Apparatus

“Because Man Only Has Two Hands!”

FIG. 1

Basic Life Support

Whether your service is BLS or ALS, the **Berg Resuscitation Apparatus** can help you administer safe and effective ventilations while eliminating personnel shortages and saving money. The **B.R.A.** combined with your 40 l/min. demand valve is a simple yet effective resuscitator.

The **B.R.A.** allows two medics to perform two-person CPR by allowing one medic to control both the ventilations and chest compressions with the use of the remote trigger. Now the second medic can concentrate on a more effective two-hand mask seal and other advanced airway procedures.

FIGURE 1

Once the patient is intubated, one medic is now completely hands-free to perform ALS procedures while the second medic continues to perform uninterrupted two-person CPR alone. **FIGURE 2**

FIG. 2

Advanced Life Support

The **B.R.A.**'s simple design makes it easy to be used by both **Basic** or **Advanced** Life Support Teams. The **B.R.A.** is lightweight, can be used almost anywhere, and costs hundreds of dollars less than other ventilators. For a no obligation 30-day trial of this unique product, simply send us a letter on your service's letterhead. Experience for yourself the advantages of the **B.R.A.**

Remote Trigger allows the rescuer to control ventilations while performing other functions, i.e. creating two-handed mask seal or chest compressions.

Coiled steel cable stays flexible and functional under repeated punishment.

Alert valve sounds a tone when resistance pressures approach 50cm H₂O, as in obstruction or poor lung compliance.

Flexible respiratory tubing.

Ultra-high density canister houses and protects your demand valve.

One way patient valve is disposable and includes built-in adjustable P.E.E.P.
