Important Discoveries in the Preparation of Antitoxic Serums.

ANTI-TYPHOID SERUM.

It will be remembered that we were the first firm in the British Empire to issue, in the dry form, Anti-Diphtheritic Serum possessing the full potency of the liquid preparation. Dried Serums are much more resistant to adverse climatic conditions than the liquid preparations. Further, they may be readily dissolved in small quantities of cooled sterilized water, and the bulk of the injection thus materially reduced. An important addition to the list of Antitoxic Serums has been made by the application of an exactly similar process of desiccation to Anti-Typhoid Serum, which is thereby obtained in the form of perfectly germ-free, lustrous golden scales. These, when dissolved in water, form a Serum of the same character and potency as the liquid Anti-Typhoid Serum we have been issuing for some time.

ANTI-SYPHILITIC SERUM.

Investigations, undertaken with an object similar to that in the case of Anti-Typhoid Serum, have terminated with equal success, and we are now in a position to offer Anti-Syphilitic Serum of full potency in a dried form. This, we believe, establishes another record. The treatment of secondary and tertiary manifestations of syphilis by antitoxin is fast emerging from the experimental stage. Private as well as public English reports, confirming the results obtained by Continental observers, show that the new Serum may be used with every prospect of success.— (See *British Medical Journal*, Feb. 8th, 1896.)

ANTI-DIPHTHERITIC SERUM.

The report on the use, during 1895, of Anti-Diphtheritic Serum in the hospitals of the Metropolitan Asylums Board contains some important statistics which will repay careful and detailed perusal. In this place it is possible to draw general conclusions only. One of the most striking facts seems to be that, in the six hospitals in question, about 250 lives that would have been lost under other methods of treatment have been saved by antitoxin during the year under consideration.

Dried Anti-Diphtheritic Serum is little liable to undergo decomposition, or changes of any nature, and is quite as effective as the liquid form. As it is readily soluble in a small quantity of water, it may be injected by means of an ordinary hypodermic syringe.
