DEPAMIDE

VALPROMIDE

*La Réponse CLIN DIPHAC
au service de votre présent*

DEPAMIDE - FORME ET PRESENTATION Boîte de 30 comprimés enrobés gastro-résistants dosés à 300 mg de valpromide. **PROPRIETES** : Anticonvulsivant. Sédatif. **INDICATIONS** : Traitement adjuvant dans les épilepsies avec manifestations psychiatriques. **Proposé dans** : - La prévention des rechutes chez les malades atteints de psychose maniaco-dépressive et présentant une contre-indication à l'emploi du lithium. - Les états d'agressivité d'origines diverses. **PRECAUTIONS D'EMPLOI** : - Surveillance particulière chez les vieillards et chez les sujets atteints d'affections organiques graves. - Potentialisation des effets de l'alcool. L'absorption de boissons alcoolisées pendant le traitement est donc formellement déconseillée. **Grossesse** : pas de données précises à ce jour concernant DEPAMIDE. Ce dernier se transformant en grande partie en acide valproïque, des moyens contraceptifs efficaces sont indiqués pendant la durée du traitement. Si une grossesse est envisagée ou si une grossesse est en cours, peser à nouveau l'indication du traitement. **Surveillance anténatale**. **INTERACTIONS MEDICAMENTEUSES** : - Potentialisation des effets d'autres psychotropes, psycholéptiques ou antidépresseurs surtout à doses élevées. - Risque d'asthénie ou de somnolence en cas d'adjonction aux barbituriques ou à d'autres médicaments dépressifs du SNC. - Association déconseillée avec la carbamazépine. **EFFETS INDESIRABLES** : Le plus souvent, en association avec d'autres psychotropes : manifestations sédatives, hypotoniques, confusionnelles et quelquefois confuso-oniriques. Le valpromide ayant pour métabolite actif l'acide valproïque, les effets indésirables observés avec le valproate de sodium (Dépakine) sont susceptibles de survenir lors de traitements par Dépamide. La survenue d'hépatopathies est exceptionnelle. Néanmoins, l'apparition soudaine de signes généraux (malaise, nausées, vomissements, somnolence...) doit faire évoquer le diagnostic et pratiquer un contrôle biologique des fonctions hépatiques (taux de prothrombine notamment). **MODE D'EMPLOI ET POSOLOGIE** : Les doses quotidiennes conseillées chez l'adulte en fonction des indications sont : - dans les troubles thymiques : **Accès maniaques** : Posologie initiale : 4 à 6 comprimés. Traitement d'entretien : 2 à 4 comprimés. **Etats dépressifs** : Posologie initiale : 1 à 3 comprimés. Traitement d'entretien : 2 à 4 comprimés. - dans le traitement adjuvant des épilepsies avec manifestations psychiatriques, états agressifs : en moyenne 2 à 6 comprimés. Répartir les doses en 2 prises, matin et soir, de préférence au cours des repas. Mise en route du traitement : - si DEPAMIDE est prescrit seul, les doses utiles peuvent être administrées d'emblée ou par paliers ascendants de 2 à 3 jours. - s'il s'agit d'un malade déjà en traitement et recevant d'autres psychotropes, il convient d'introduire DEPAMIDE progressivement pour atteindre la dose optimum en deux semaines environ, et de réduire simultanément peu à peu la posologie des psychotropes associés pour la ramener à la moitié ou même au tiers des doses initiales. **Coût du traitement journalier** : 1.51 à 9.06 F. **SURDOSAGE** : Coma calme plus ou moins profond avec hypotonie musculaire, hyporéflexie, myosis, diminution de l'autonomie respiratoire. **LISTEII A M.M. 320 706.1**. Mis sur le marché en 1980 sous forme de comprimés (1^{ère} mise sur le marché en 1971 sous forme de gélules). **PRIX** : 45.30 F. Remb. Séc. Soc. à 70 % - Collectivités. Aims & Scope

Founded 20 years ago, this journal covers the entire field of clinical neurophysiology and addresses all those interested in electroencephalography, electromyography, evoked potentials and other investigative approaches in neurology and psychiatry, and, in general, in the functional exploration of the nervous system and its pathophysiology.

Neurophysiologie clinique/Clinical Neurophysiology, as the official publication of the French-speaking Société de Neurophysiologie Clinique, publishes review articles, original articles, short communications, and letters to the editor presented at the meetings of the Society, as well as articles directly submitted to the editorial board.

All manuscripts are reviewed by two experts, one of whom is usually non-French. The majority of articles are presented in French but the journal equally accepts papers written in English. Abstracts both in English and French.

Freud Evaluated - The Completed Arc

by M. Macmillan

(Advances in Psychology, 75)

This volume is an historically based critical evaluation of Freud's personality theory. In it the observations Freud made are described and the theoretical ideas he put forward for explaining them are set out. The adequacy of Freud's explanations are judged against the logical and scientific standards of Freud's own time. The historical perspective will give the reader a sound basis on which to make a judgement about psycho-analysis as a method of investigation and a theory of personality as well as a sense of what Freud was about from Freud's own standpoint.

Freud's endeavour is sited in the psychological and psychiatric context of the time, a period not previously given the critical attention it warrants. All of Freud's important assumptions and characteristic modes of thought are to be found in this formative period. The placement also brings out more clearly the basis of a number of the unresolved problems of contemporary

psycho-analytic theory, such as the place of affect and the instinctual drives, the role of the ego, and the basis of treatment. The core of the evaluation centres on Freud's basic method for gathering data - free association - a method which is not much written about and hardly ever criticised. What is said about it is new and more substantial than the few criticisms that have been made. Although a very critical work, there is probably no other appraisal which allows Freud and his colleagues and followers to speak so directly for themselves.
