Ingots for Industry

Consumption of MAGNESIUM in Britain continues to rise and more of this ultra light metal was used in 1955 for civilian applications than ever before. Supplies are ample and raw materials unlimited.

pioneers of Magnesium and Magnesium Alloys in this country for the past 21 years, and sole producers of virgin metal today, possess an important research organisation as well as facilities for manufacture, development and control of the alloys that are without rival in Britain.

THE "SKEETER" Mk. 6

BECAUSE—

The handling qualities, due in part to its three bladed fully articulated rotor are just those found in the larger types of helicopter. It is not difficult to fly, and the manoeuvrability is exceptional.

The throttle may readily be disconnected from the collective pitch lever, permitting practice autorotative landings without stopping the engine, and the engine may safely be left running on the ground.

The engine of 'One Hour Power' rating gives consistent and undiminished performance.

All maintenance can be done from ground level except for the main rotor hub which is reached by using footholds on the helicopter structure.

Vision from the cockpit is unusually good, with a wide aspect rearwards.

A manual control of the centrifugal clutch prevents overloading of the rotor system when starting.

These are some of the features of the Skeeter helicopter which commend it for its chosen duties. Each of them contributes towards the economy which is a feature of its initial and operating costs.

TRANSMISSION

The Bristol Type 171 Sycamore Helicopter uses LAYRUB as the main drive between engine and rotor.

Layrub couplings use rubber trunnion blocks as the main driving elements giving a fully cushioned drive. As there are no metal to metal contacts no lubrication is required, therefore little or no maintenance.

Other well-known British aircraft on which Layrub is used either as auxiliary or main drive include Bristol Type 173 Helicopter and Bristol Britannia.

A post card will see full technical data on its way to you.

The power of the Bristol Sycamore

The power unit of the Bristol Sycamore is the Alvis LEONIDES air-cooled radial engine that has been tested and proved in both tropical and Arctic conditions. Inherent reliability through a decade of operational service with the Royal Air Force has established the LEONIDES as the standard power unit for most British helicopters.

The Westland
WIDGEON

The Westland Widgeon is the latest general purpose medium size Helicopter to be built in Britain. It is a development of the famous and versatile Dragonfly and incorporates many of the well tried and highly successful engineering features which have been responsible for the outstanding success of Westland Helicopters.

With accommodation for four passengers and pilot—or two stretcher cases, medical attendant and pilot—it offers great possibilities for many civil and military roles.

OBJECTS OF THE ASSOCIATION

The objects of the Association are to collect compile and disseminate information of a technical and semi technical nature pertaining to Helicopters and all other types of Rotating Wing Aircraft The Association aims to work in close co operation with existing Aeronautical Bodies on matters affecting its objects and it may act as an Advisory Body in the promotion of legislation calculated to be of benefit to the development of Rotating Wing Aircraft
