THE UNIVERSITY SERIES IN HIGHER MATHEMATICS

3 new Van Nostrand books this summer

● COMMUTATIVE ALGEBRA VOLUME II

Oscar Zariski and **Pierre Samuel**

Professor of Mathematics, Harvard University — Prof. of Mathematics, Univ. de Clermont-Ferrand

This volume, devoted to valuation theory, polynomial and power series rings, and local algebra, completes a systematic treatment of the subject. Of Vol. I, reviewers wrote "a thorough and scholarly account . likely to become the standard work." (Matrix & Tensor Qtly.) "A pleasure to read and its many valuable features will ensure its use both to the specialist and to the beginner needing an introductory text." (A. W Goldie in this Gazette.)

Vol. II due July 1960.

Vol. 1. Groups, rings, fields, vector spaces, ideals, modules, Noetherian Rings and Dedekind Domains. xii + 329 pp., 52s. 6d.

● GENERAL THEORY OF BANACH ALGEBRAS

Charles E. Rickart Prof. & Chairman of Dept. of Mathematics, Yale University

This book will be valued as a reference, for its wealth of material, and as an introductory text, on account of its lucid and interesting style. Briefly, chapters are devoted to basic concepts and results, structure properties of general Banach algebras (based on N. Jacobson's structure theory for arbitrary rings), and two special cases — commutative Banach algebras and Banach algebras with an involution. Abt. 73s.

● RINGS OF CONTINUOUS FUNCTIONS

Leonard Gillman and **Meyer Jerison**

Both Associate Professors of Mathematics, Purdue University

This book gives the first systematic account of the theory of rings of continuous functions, a subject that has been under development for about twenty-five years. Some of the material has not been published before; most of it appears in book form for the first time. Abt. 52s. 6d.

and a new, revised edition

● PROBABILITY THEORY 2nd edn

Michel Loève Professor of Mathematics & Statistics, University of California

Two new chapters (XI, Random functions and processes, and XII, Markov processes) have been added and a large number of minor changes made throughout. Of the 1st edn., S. Vajda wrote "Nothing else of this type exists for the benefit of the serious student" in Z. BLATT FÜR MATH. and J. Wolfowitz called it "A very valuable addition to the literature, a work of scholarship" in MATH. REVIEWS. Abt. 112s. 6d.

There are six other books in this series: Commutative Algebra Vol. I, General Topology by Prof. John L. Kelley, An Intro. to Abstract Harmonic Analysis by Prof. L. H. Loomis, Measure Theory by Prof. P R. Halmos, Lectures in Abstract Algebra by Prof. Nathan Jacobson and Analytic Theory of Continued Fractions by Prof. H. S. Wall. May we send you a descriptive leaflet?

SCHOOL MATHEMATICS

R. WALKER, M.A., Senior Mathematics Master, Stowe School

The five books of this course in Mathematics are designed for use in Secondary Schools, and will cover the ground up to the standard of 'O' level G.C.E. Particular attention has been given to the problem of making the text easily intelligible to the pupil, so that if the opportunity arises, he or she can forge ahead with little assistance from the teacher.

Book 1, *ready June* about **9s.** **Books 2–5** *in preparation*

THE LANGUAGE OF NUMBER

M. KLINE, B.Sc., Senior Mathematics Master, West Park (Leeds) Secondary School

A new, logically developed, concentric Arithmetic course in three volumes, embodying many of the recommendations of the Ministry of Education's pamphlet No. 36, *The Teaching of Mathematics in Secondary Schools.* It is wide enough in scope and has sufficient examples to fit the needs of pupils taking work up to the level of R.S.A. and 'O' level G.C.E. However, very little knowledge beyond the four rules in number, money, weights and measures is assumed at the outset, and revision of these is catered for. The course will be particularly useful for slower workers who require an especially thorough treatment.

Book 1, *now available*, **7s. 6d.**
Book 2, *Summer*, **Book 3,** *Autumn*

GRAPHS FOR INTERPRETATION

GORDON L. BELL, M.A., Principal Teacher of Mathematics, Norton Park Secondary School, Edinburgh

The aim of this book is to interest and train pupils in interpreting graphs by providing many of these graphs already drawn, to provide a natural sequence which will simplify progress from type to type, to introduce at appropriate stages such essential features as scales, variables, continuity etc., and to give the pupils sufficient practice in drawing their own graphs to ensure that they can apply the knowledge gained. *Ready June*, **7s. 6d.**

COLLEGE ALGEBRA AND TRIGONOMETRY

WILLIAM L. HART, Professor of Mathematics, University of Minnesota.

Mature in its approach, this book does not in general, however, go beyond the requirements of G.C.E. 'A' level. The treatment is modern and thorough, and includes chapters on set terminology, probability and general systems of linear equations. **40s.**

DAILY LIFE MATHEMATICS

BY P F BURNS, B.Sc., F.R.A.S.

This course for secondary schools is now completed by the publication of Book Five*

This course deals with the mathematical aspects of the modern world, and succeeds in the practical aim of teaching children to manipulate numbers, as well as the cultural one of introducing them to mathematical ideas. Mathematics is treated as one subject, not divided into separate branches.

Because of the wide range of ability among pupils for whom the course is intended the contents have been arranged on a concentric plan, each book making up a relatively complete course. For grammar and technical school pupils Book One will not be necessary; they will find that Books Two, Three and Four make a sound basis for the more formal trigonometry, geometry, and algebra needed for G.C.E.

Book Five, which has just been added to the course, as well as covering G.C.E. requirements in algebra, geometry, and trigonometry, contains a simple approach to the calculus for students taking the Alternative Syllabus in mathematics and for those in industry who are aiming at Ordinary National Certificates in appropriate branches of technology.

BOOK ONE

288 pages 11s. 6d.

BOOK TWO

256 pages 10s. 6d.

BOOK THREE

224 pages 10s. 6d.

BOOK FOUR

256 pages 11s. 6d.

Answers to Books One to Four each 1s. 6d.

*BOOK FIVE

352 pages 15s. 6d.

Answers to Book Five 2s. 3d.

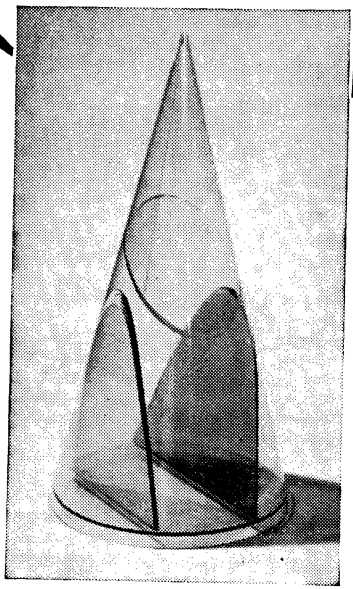
Teach Mathematics by VISUAL AIDS



Cone with ellipse, hyperbola and parabola. Height 26 cm.

The close co-operation and guidance of many of the world's leading mathematicians have contributed in the manufacture of these Transparent Educational Models. They are unique in the field of visual teaching aids for advanced Mathematics, having decided advantages over the more-usual solid-type models for demonstration purposes. A range of transparent models is available to cover all aspects of mathematical teaching.

FLIGHT WITHOUT FORMULAE

By A. C. Kermode

Third Edition

This readable approach to a technical subject, has sold all over the world to serious students of aeronautics. Now it has been heavily revised. New material has been included on the problems of high-speed flight and a new section added on missiles, satellites and space-ships. Price 21/– net.

Just Published

ELEMENTARY COORDINATE GEOMETRY

by CLEMENT V. DURELL, M.A. *Complete, 17s. 6d. Part I separately, 12s. 6d.*

This new book provides a course of coordinate geometry covering G.C.E. requirements at Advanced and Scholarship level. Part I which deals with A level work is available separately. Full use has been made of recommendations contained in the Mathematical Association's Report on the *Teaching of Higher Geometry in Schools.*

In the early chapters the author has provided numerous examples designed to enable the pupil to write down readily equations of lines satisfying given conditions, to express ratio and distance relations algebraically, and conversely to interpret algebraic relations in geometrical language. These help the pupil to acquire facility in the fundamental processes on which the use of coordinate methods depends.

Other important features are the detailed discussion of measurement of lengths of steps by directed numbers, emphasis on the use of parameters, the late introduction of determinants, the comparison, by means of examples, of geometrical and algebraic forms of proof and the introduction in the more difficult applications of Part II of more general and more powerful methods in place of the elaborate algebraic manipulation of the old fashioned analytical conics.

Reissue Immediately

PUZZLE PAPERS IN ARITHMETIC

by F. C. BOON, B.A. *New edition, revised by* H. MARTYN CUNDY, M.A., Ph.D., *Senior Mathematical Master, Sherborne School. 64 pages. About 3s.*

This little book has been reissued in response to the considerable interest expressed in teaching circles. A number of examples have been brought up to date and two new papers added.

" The author's claim that the ' pupils evince a sprightlier attitude which quickens their pace in the formal work ' is amply justified and the intriguing nature of the problems contributes largely towards this. It is no exaggeration to say that every teacher of school mathematics should use the book regularly." MATHEMATICAL GAZETTE
