Introduction: Unintended pregnancy continue to many countries in the world especially among teenagers.

Aims: The aim of this study was to assess the prevalence of post-partum blues in teenage mothers with unintended pregnancy, compared with teenage mothers with planned pregnancy.

Methods: 100 normal primiparous women with age less than 19 were studied and divided two groups who had unintended pregnancy and planned pregnancy. Maternity blues assessed in two groups.

Results: There was postpartum blues in women with unwanted pregnancies more than women with planned pregnancies in 3 and 10 days after delivery and this deferences are statistically significant.

Conclusions: unintended pregnancy may be a potential causal factor for maternity postpartum blues in teenagers.
